

How to price a job without leaving money on the table

The math nobody teaches you in the apprenticeship.

02

Markup is not margin

A 50% markup is only a 33% margin. That gap is on every job you quote, all year.

03

Know your 3 numbers

Direct cost, overhead, and profit. You can't price what you can't see.

04

The one formula

Price = cost ÷ (1 – target margin). A \$400 job at 55% margin = \$889.

05

Stop racing to the bottom

Win the customer before it's a bidding war — then you price for margin, not survival.

What should you charge?
